Preface

This guide is for library customers, partners, third party management software developers, and other parties interested in integrating the Scalar® i40 and Scalar i80 with commercial management frameworks. It assumes that you have a working knowledge of Simple Network Management Protocol (SNMP), that you can compile a Management Information Base (MIB) on your framework application, that you can perform SNMP GET operations, and that you know how to collect SNMP TRAPs and filter them for information.

This guide describes information that you can obtain from the Scalar i40 and Scalar i80 library SNMP. Using SNMP, you can monitor the library from a network management application rather than — or in addition to — the library’s diagnostic ticket system. For information about the Scalar i40 and Scalar i80 libraries, refer to the *Scalar i40 and Scalar i80 User’s Guide*.

The Scalar i40 and Scalar i80 libraries support SNMP by publishing a MIB that can be queried to obtain the status of the library and many of its individual components. You can obtain status information automatically by configuring the library to send alerts using SNMP TRAPs, or you can obtain it on an ad-hoc basis by sending SNMP queries from your network management application.

For more information about the library MIBs, contact Quantum Support. For information on integrating MIBs with an SNMP management application, contact your network management application vendor.

Explanation of Symbols and Notes

The following symbols appear throughout this document to highlight important information.

Note: Note emphasizes important information related to the main topic.

Caution: Caution indicates potential hazards to equipment or data.

WARNING: Warning indicates potential hazards to personal safety.

Other Documents You Might Need

The following documents are also available for this product.

Document Number	Document Title
6-66545-xx	Scalar i40 and Scalar i80 User's Guide
6-66546-xx	Scalar i40 and Scalar i80 Quick Start Guide
6-00618-xx	System, Safety, and Regulatory Information
6-66547-xx	Scalar i40 and Scalar i80 Release Notes
6-00423-xx	Quantum Intelligent Libraries SCSI Reference Guide
6-01317-xx	Quantum Intelligent Libraries SMI-S Reference Guide

Quantum company contacts are listed below.

Quantum Corporate Headquarters

For information about contacting Quantum, including Quantum office locations, go to:

Getting More Information or Help

The following resources are available for general product support:

- **Service and Support Website** - Register products, license software, browse Quantum Learning courses, check backup software and operating system support, and locate manuals, FAQs, firmware downloads, product updates and more in one convenient location. Benefit today at:

<http://www.quantum.com/support>

- **Telephone Support** - To find contact information for your location, go to: <http://www.quantum.com/ServiceandSupport/Contacts/ProductSelect/Index.aspx>
- **eSupport** - Submit online service requests, update contact information, add attachments, and receive status updates via email. Online Service accounts are free from Quantum. That account can also be used to access Quantum's Knowledge Base, a comprehensive repository of product support information. Sign up today at:

Chapter 1 Description

The Simple Network Management Protocol (SNMP) is a light-weight protocol designed for remote management and monitoring of infrastructure devices. The Scalar[®] i40 and Scalar i80 libraries provide SNMP support so you can use a framework application to monitor the status of the library. Using SNMP, you can be alerted of numerous library events.

The Scalar i40 and Scalar i80 libraries also provide informational troubleshooting procedures from their own reporting system, called the diagnostic ticket system. Diagnostic tickets enable library administrators to diagnose specific library events.

SNMP Functionality Available to Remote Applications

Both the Scalar i40 and Scalar i80 libraries support SNMP GET queries and unicast TRAPs (which can be sent only to registered recipients), that enable you to monitor library status from a remote application. SET commands are currently not enabled on the Scalar i40 and Scalar i80.

Specific Scalar i40 and Scalar i80 SNMP characteristics include:

- Supports SNMP v1, v2c, and v3
- Supports SNMP v1 and v2 TRAPs as defined by RFC 1157. You can set the library to report SNMP TRAPs using either v1 or v2 (v1 is the default). The timeout for all SNMP requests to the library must be at 10 seconds or greater (command line parameter-t).
- SMIv2 compliance only
- Usage of port 161 for GET queries
- Default community read/TRAP strings: *publicCmtyStr* (see [SNMP Community Strings](#) on page 8)
- TRAP registration interface in the library's Web client, which enables you to configure application IP addresses, transport protocols, and user-configurable UDP port numbers to receive TRAPs

Accessing SNMP Information

SNMP information can be obtained from the Scalar i40 and Scalar i80 using TRAPs and GET queries. Using the information contained in this guide, library administrators can configure their framework application to generate alerts to receive Scalar i40 and Scalar i80 SNMP information.

By default, most SNMP information is returned as an integer value (library partition names, however, are returned as string values). For instance, the return value of `physicalLibraryState` might be 2, which indicates that the robotics is not ready.

You can, however, configure the framework application to return status information as a string value, which provides a description of the status. For example, the return value of `physicalLibraryState` might be `notReady(2)`.

SNMPv3

Although the Scalar i40 and Scalar i80 support SNMP version 1 and version 2c for MIB information retrieval, we strongly recommend that you access the library using SNMP version 3 (SNMPv3). SNMPv3 is the most secure of the three versions, as it supports message digest 5, or MD5, as its authentication protocol.

To access the library for SNMP support, use the following values as needed in the remote management application:

User name: Admin

Context name: (None. Leave this field blank.)

Authentication protocol: MD5

Privacy protocol: (None. Leave this field blank.)

Password: Your Admin password

For secure access to the library using SNMP, disable SNMPv1 and SNMPv2c access from the Web client and the operator panel. For more information, see either the *Scalar i40 and Scalar i80 User's Guide* or the relevant Scalar i40 and Scalar i80 Web client online help topics.

SNMP TRAPS

TRAPs enable alerts to be sent automatically to registered hosts when specific events occur. Only one application per UDP port can listen for TRAPs.

The Scalar i40 and Scalar i80 supports SNMP v1 and v2 TRAPs as defined by RFC 1157.

You can set the library to report SNMP TRAPs using either v1 or v2 (v1 is the default). The timeout for all SNMP requests to the library must be at 10 seconds or greater (command line parameter-t).

To receive TRAPs, you must perform two steps:

- 1 Configure your framework application to collect TRAPs from the Scalar i40 and Scalar i80.
- 2 Using the library's **SNMP Trap Registrations** feature, register the host's IP address, transport protocol, and UDP port number.

Registration informs the Scalar i40 and Scalar i80 to send TRAPs to the host.

For additional details about registering a host with the Scalar i40 and Scalar i80, refer to the *Scalar i40 and Scalar i80 User's Guide*.

SNMP Queries

SNMP queries, or GET queries, can be initiated on a periodic basis by the framework application. By querying the MIB, hosts can gather status information about specific components of the library. Frequent MIB queries are not required, however, since the SNMP agent is event-driven, it provides updated data if a TRAP alerts of an event or status change.

Caution: As with any SNMP device, excessive MIB queries can result in performance degradation for the SNMP daemon, as well as for the network.

GETs must also include an instance ID. The instance identifies a specific device from which you can retrieve status information. For example, to determine if the second partition on a Scalar i40 and Scalar i80 is online, access the MIB variable for logical library online status and select the instance for partition 2.

SNMP Community Strings

An SNMP community string is a text string that acts as a password to authenticate messages sent between the SNMP remote management application and the device (the SNMP agent). SNMP **Get** and **Get-next** requests are valid only if the community string in the request matches the community string at the device. If the community strings do not match, either modify the community string at the device so that it is the string that the management station expects, or modify the management station so that it uses the device's community strings.

The community string is included in every SNMPv1 and SNMPv2C packet transmitted between the SNMP manager and the SNMP agent. This string is case sensitive, cannot be empty, and cannot exceed 32 characters.

Use this procedure to configure the read-only SNMP community string.

- 1 Log in to the Web client.
- 2 Select **Setup > Network Management > SNMP**.

- 3 Change the community string value.
- 4 Click **Apply**.

SNMP Authentication TRAPs

SNMP authentication TRAPs occur in a number of conditions. In particular, they can occur when the SNMP agent:

- Receives a request that does not contain the correct community name.
- Receives a request not sent from a member of the acceptable host list.
- Receives a request from a bad user name or password when using SNMP Version 3.
- Sends an authentication TRAP message to one or more TRAP destinations (management systems), indicating authentication failure.

By default, authentication TRAPs are disabled on the library. Use this procedure to configure SNMP authentication TRAPs.

- 1 Log in to the Web client.
- 2 Select **Setup > Network Management > SNMP**.
- 3 Do one of the following:
 - Click the **Authentication TRAPs** check box to enable authentication TRAPs.
 - Remove the check from the **Authentication TRAPs** check box to disable authentication TRAPs.
- 4 Click **Apply**.

Chapter 2

SNMP TRAPS

This section describes the basic set of Simple Network Management Protocol (SNMP) system status TRAPs issued by the library. TRAPs pertain to the entire library, not specific partitions.

Note: The Scalar i40 and Scalar i80 support SNMP v1 and v2 TRAPs as defined by RFC 1157.

TRAPs defined in the Tape Library Management Information Base (MIB) are issued with enterprise OID 1.3.6.1.4.1.3764.1.10.10.

Table 1 Status TRAPs

TRAP ID	TRAP	Description
1	tapeLibNotifyStart	Starting Indicates that the tape library agent has started running.
2	shutdownSequenceInitiated	Shutdown Sequence Initiated Notification that the library has started its shutdown sequence.
3	tapeLibNotifyRestart	Restarting Notification that the tape library agent has been restarted. This indication does not imply any configuration change (unlike the standard coldStart or warmStart TRAPs).
101	startupSequenceCompleted	Startup Sequence Completed Indicates that the library has completed its boot sequence.
104	moduleDoorStatusChange	Module Door Status Change Indicates that a library storage magazine has been unlocked, removed, or inserted.
105	ieDoorStatusChange	I/E Door Status Change Indicates that an I/E station has been opened or closed.
106	roboticsReady	Robotics Ready Indicates that the library's robotics system has transitioned from a "not ready" to "ready" state. TRAPs 106 and 107 may occur as part of a startup or shutdown procedure.
<p>a. The library issues a TRAP whenever the aggregate state of one of the Reliability, Availability, and Serviceability (RAS) status groups changes. Listening for these TRAPs (rather than querying for them) is the preferred method of monitoring the health of the library.</p>		

TRAP ID	TRAP	Description
107	roboticsNotReady	Robotics Not Ready Indicates that the library's robotics system has transitioned from a "ready" to "not ready" state. TRAPs 106 and 107 may occur as part of a startup or shutdown procedure.
108	logicalLibraryStatusChange	Logical Library State or Mode Change Indicates that a logical library, also known as a partition, has changed its ready state, and/or has been taken online or offline.
109	connectivityStatusChange	Note: This TRAP is currently not supported. Connectivity Status Changes are reported via TRAP 110, Control Status Change.
110	controlStatusChange	RAS Status Change: Control ^a Indicates that a library control problem has been detected. Indicates that the status of the library control subsystem (which includes all library components except for drives and media) has changed. If the TRAP payload Control Status variable indicates that a problem exists, use the operator panel or Web client to determine how to resolve the issue.
111	coolingStatusChange	Note: This TRAP is currently not supported. Cooling Status Changes are reported via TRAP 110, Control Status Change.
112	drivesStatusChange	RAS Status Change: Drives ^a Indicates that the status of the drives and/or media has changed. If the TRAP payload Drive Status variable indicates that a problem exists, use the operator panel or remote web client to determine how to resolve the issue.
<p>a. The library issues a TRAP whenever the aggregate state of one of the Reliability, Availability, and Serviceability (RAS) status groups changes. Listening for these TRAPs (rather than querying for them) is the preferred method of monitoring the health of the library.</p>		

TRAP ID	TRAP	Description
113	mediaStatusChange	RAS Status Change: Media ^a Indicates that the status of the media has changed. If the TRAP payload Media Status variable indicates that a problem exists, use the operator panel or remote web client to determine how to resolve the issue.
114	powerStatusChange	Note: This TRAP is currently not supported. Power Status Changes are reported via TRAP 110, Control Status Change.
115	roboticsStatusChange	Note: This TRAP is currently not supported. Robotics Status Changes are reported via TRAP 110, Control Status Change.
116	operatorInterventionRequired	RAS Status Change: Operator Intervention Required ^a Indicates that an error has occurred and that operator intervention is required in order to resolve the issue.
117	driveOnlineStateChange	Drive Online State Change Indicates that a tape drive has been taken online or offline.
<p>a. The library issues a TRAP whenever the aggregate state of one of the Reliability, Availability, and Serviceability (RAS) status groups changes. Listening for these TRAPs (rather than querying for them) is the preferred method of monitoring the health of the library.</p>		

Appendix A

MIBs Implemented

The library requires five Management Information Bases (MIBs): the Quantum Tape Library MIB and four standard SNMP MIBs.

Quantum Small Tape Library MIB

The Quantum Tape Library MIB provides the following information:

- System identification (library model and serial number)
- Notifications for a changed configuration (added and removed components)
- Library startup and shutdown TRAPs
- Library online and offline status
- Library composition
 - Drives
 - Robotics
- Library partitioning
- Advanced status information: Reliability, Availability and Serviceability (RAS) functionality

Reference MIBs

The library MIBs reference the following SNMP standard MIBs:

- IPV6-MIB of MIB II
- IP-MIB of MIB II
- RFC 1155-SMI
- RFC 1212
- RFC 1213-MIB
- RFC 1215

These MIBs must be included with your framework application. They are required for accurate compilation of the library MIBs.

Downloading the SNMP MIB from the Library

Administrative users can download the SNMP MIB from the library. The MIB can then be installed on an SNMP external management application.

To download the SNMP MIB:

- 1 From the library Web client, select **Tools > Download SNMP MIB**.
- 2 Save the file to a known location.
